

EPC2204 – Enhancement Mode Power Transistor

 $V_{DS}, 100\text{ V}$
 $R_{DS(on)}, 6\text{ m}\Omega$
 $I_D, 29\text{ A}$

Gallium Nitride's exceptionally high electron mobility and low temperature coefficient allows very low $R_{DS(on)}$, while its lateral device structure and majority carrier diode provide exceptionally low Q_G and zero Q_{RR} . The end result is a device that can handle tasks where very high switching frequency, and low on-time are beneficial as well as those where on-state losses dominate.

Application Notes:

- Easy-to-use and reliable gate, Gate Drive ON = 5–5.25 V typical, OFF = 0 V (negative voltage not needed)
- Top of FET is electrically connected to source

Die Size: 2.5 x 1.5 mm

EPC2204 eGaN® FETs are supplied only in passivated die form with solder bars.

Applications

- DC-DC Converters
- Isolated DC-DC Converters
- Lidar
- Sync rectification for AC-DC and DC-DC
- Point of Load Converters
- USB-C
- Class-D Audio
- LED Lighting
- eMobility

Benefits

- Ultra High Efficiency
- No Reverse Recovery
- Ultra Low Q_G
- Small Footprint

Recommended stencil should be 4 mil (100 μm) thick, must be laser cut, openings per drawing.

The corner has a radius of R60.

Intended for use with SAC305 Type 4 solder, reference 88.5% metals content.

Split stencil design can be provided upon request, but EPC has tested this stencil design and not found any scooping issues.

LAYOUT CONSIDERATIONS

GaN transistors generally behave like power MOSFETs, but at much higher switching speeds and power densities, therefore layout considerations are very important, and care must be taken to minimize layout parasitic inductances. The recommended design utilizes the first inner layer as a power loop return path. This return path is located directly beneath the top layer's power loop allowing for the smallest physical loop size. This method is also commonly referred to as flux cancellation. Variations of this concept can be implemented by placing the bus capacitors either next to the high side device, next to the low side device, or between the low and high side devices, but in all cases the loop is closed using the first inner layer right beneath the devices.

A similar concept is also used for the gate loop, with the return gate loop located directly under the turn ON and OFF gate resistors.

Furthermore, to minimize the common source inductance between power and gate loops, the power and gate loops are laid out perpendicular to each other, and a via next to the source pad closest to the gate pad is used as Kelvin connection for the gate driver return path.

The [EPC9097 Half-Bridge Development Board Using EPC2204](#) implements our recommended vertical inner layout.

Figure 13: Inner vertical layout for power and gate loops from EPC9097

Detailed recommendations on layout can be found on EPC's website: [Optimizing PCB Layout with eGaN FETs.pdf](#)

TYPICAL SWITCHING BEHAVIOR

The following typical switching waveforms are captured in these conditions:

- [EPC9097 Half-Bridge Development Board Using EPC2204](#)
- Gate driver: uP1966E with 0.4 Ω /0.7 Ω pull-down/pull-up resistance
- External $R_G(\text{ON}) = 1 \Omega$, $R_G(\text{OFF}) = 0 \Omega$
- $V_{\text{IN}} = 48 \text{ V}$, $I_L = 25 \text{ A}$

Figure 14: Typical half-bridge voltage switching waveforms

See the [EPC9097 Quick Start Guide \(QSG\)](#) for more information.

TYPICAL THERMAL CONCEPT

The EPC2204 can take advantage of dual sided cooling to maximize its heat dissipation capabilities in high power density designs. **Note that the top of EPC FETs are connected to source potential, so for half-bridge topologies the Thermal Interface Material (TIM) needs to provide electrical isolation to the heatsink.**

Recommended best practice thermal solutions are covered in detail in [How2AppNote012 - How to Get More Power Out of an eGaN Converter.pdf](#).

Figure 15: Exploded view of heatsink assembly using screws

Figure 16: A cross-section image of dual sided thermal solution

Note: Connecting the heatsink to ground is recommended and can significantly improve radiated EMI

The thermal design can be optimized by using the [GaN FET Thermal Calculator](#) on EPC's website.

Solder mask defined pads are recommended for best reliability.
